

CLOUD SEEDING PROGRAM

2022 Operations Report

Published January 2024

Safety is always our number one priority

snowyhydro

We acknowledge the Traditional Custodians of
this land, waterways and community.

And pay our respects to their Elders past,
present and emerging, for they have, are and will
leave their footprints behind and continue to share their
history, culture and traditions.

We extend that respect to Aboriginal and Torres Strait
Islander peoples who may be with us today.

[Acknowledgement wording provided by Ngarigo Elders](#)

Introduction

Snowy Hydro Limited (Snowy Hydro) relies on precipitation falling over the catchments of the Snowy Mountains to supply water for the production of hydroelectricity. Cloud seeding over this area is used to enhance snowfall, ultimately leading to increased runoff and water available to produce energy.

Cloud seeding operations undertaken by Snowy Hydro are authorised by the Snowy Mountains Cloud Seeding Act 2004 (NSW) (SMCS Act).

The SMCS Act mandates that cloud seeding operations may only be carried out in accordance with an Environmental Management Plan (EMP) approved by the Minister administering the Environmental Planning and Assessment Act 1979, and the Minister administering Part 4 of the National Parks and Wildlife Act 1974 (the 'relevant Ministers').

Cloud seeding operations in 2022 were undertaken under the Cloud Seeding Program EMP that was formally approved by the relevant Ministers on 28 June 2018. In accordance with the SMCS Act, the EMP must be reviewed at least once every five years. The NSW Environment Protection Authority (EPA) coordinated a five-yearly review of the EMP in 2023 in consultation with Snowy Hydro, the NSW Department of Planning and Environment (DPE) and a range of stakeholders.

The SMCS Act requires Snowy Hydro, by 31 March in each year, to report on cloud seeding operations during the previous year to the relevant Ministers and to the EPA. The report must include details of compliance with the EMP and details of research monitoring the impact of seeding agents on the environment. The EPA is appointed to review each report on cloud seeding operations, and report the findings of the review and any resulting recommendations to the Board of the EPA and the relevant Ministers.

Snowy Hydro submitted the Cloud Seeding Program 2022 Annual Compliance Report to the relevant Ministers and the EPA in March 2023. The report demonstrated that Snowy Hydro has complied with all obligations set out within the EMP and responsibly carried out cloud seeding operations in accordance with the SMCS Act. Importantly, the 2022 Annual Compliance Report confirmed there continues to be no evidence of any significant adverse environmental impacts associated with cloud seeding activities.

The subsequent EPA review¹ supported these findings.

The key points of the 2022 Annual Compliance Report which are described fully in the following sections of this report:

- Operations, including the duration over which cloud seeding occurred and the total amount of cloud seeding agent released over the season;
- Meteorological monitoring, including controls to ensure precipitation falls as snow to at least 1,400 metres during cloud seeding operations and assessment of downwind impacts; and
- Environmental monitoring, including summary statistics of the monitoring program and details of research monitoring the impact of seeding agents on the environment.

Finally, the findings and recommendations of the EPA review are provided.

Operations

Target area

The SMCS Act states that the area primarily targeted for increased precipitation must land within the Snowy water catchment.

An area of approximately 2,110 km² was targeted during 2022 cloud seeding operations. Figure 1 shows both the target area and the Snowy water catchment boundaries.

Hours of operation

The SMCS Act stipulates that operations are only to be carried out when precipitation is likely to fall as snow to at least 1,400 metres. Consequently, cloud seeding operations take place throughout the cool-season months, typically between May and October.

In 2022, a total of 57 hours and 6 minutes of cloud seeding occurred between 31 May 2022 and 15 August 2022.

Seeding agent and method of discharge

Silver iodide is the approved seeding agent. Silver is naturally present in the atmosphere, soil and sediments of the Snowy Mountains. Silver iodide is used as the ice nucleating material because it has similar physical properties to an ice crystal. It is also insoluble in water and does not become biologically available in the environment. In 2022, approximately 19.1 kg of silver iodide was dispersed over the 2,110 km² target area.

Land-based aerosol generators are the approved method to disperse the seeding material. The seeding agent is released by up to 23 ground-based generators located along the western perimeter of the target area when suitable atmospheric conditions are present.

Operational incidents

There were no accidents or breakdowns resulting in spillage of cloud seeding agents, fuel, or failure of controls specified in the EMP.

A small spill (1-2 litres) of water mixed with antifreeze from a rain gauge occurred on a road during transport in October 2022. No material environmental harm was caused and corrective actions were put in place to prevent recurrence.

Meteorological Monitoring

Snow level criterion

The SMCS Act mandates that the discharge of the seeding agent is to be carried out at a time when increased precipitation is likely to fall as snow to at least 1,400 metres above sea level.

Prior to and during cloud seeding operations, weather balloons were released at intervals of three hours or less to monitor atmospheric conditions. Cloud seeding does not commence, or is suspended, if the freezing level measured over the catchment is higher than 1,600 metres. This is to ensure precipitation falls as snow to at least 1,400 metres.

Additional controls are implemented if the freezing level is between 1,550 and 1,600 metres, including monitoring live camera feeds and verifying conditions with personnel within the target area.

During 2022:

- Cloud seeding operations did not commence when the freezing level over the catchment was greater than 1,600 m.
- There were no instances where the freezing level rose above 1,600 m during operations leading to the suspension or termination of operations.
- There were no operations with observed freezing levels between 1,550-1,600 m; therefore additional controls were not triggered.

Potential downwind impact

The cloud seeding program has been designed so that additional precipitation from cloud seeding falls over the target area. A component of the design is routine monitoring of precipitation to identify any possible effects of cloud seeding extending outside the target area.

Data from the Bureau of Meteorology and Snowy Hydro weather stations provide the basis for comparison of the temporal and spatial variability of precipitation across the region during the winter months, both before and after cloud seeding operations commenced in 2004.

Analyses of precipitation amounts over 1990-2022 continue to show no evidence of an effect from cloud seeding on precipitation downwind of the target area. This supports the results of previous, independent analyses by the Natural Resources Commission (NRC)².

Environmental Monitoring

Environmental chemistry

Snowy Hydro has monitored silver concentrations in a range of environmental matrices at potential accumulation zones within and around the target area since the commencement of cloud seeding over the Snowy Mountains in 2004. Analyses of silver concentrations from samples collected prior to the commencement of cloud seeding in 2004 through to 2022 continues to show no evidence that cloud seeding has contributed to increased levels of silver in any of the areas, or in any of the environmental matrices monitored.

The objectives of the monitoring program are to detect increases in the concentrations of silver compared with baseline concentrations, and to assess concentrations of silver compared with agreed guideline values of 0.1 mg/L for potable water and 1 mg/kg for all other matrices.

The EMP prescribes the number of sampling sites for each matrix and area, the replicates collected and analysed for each site and the sampling frequency. Once environmental samples are collected, they are sent to an independent laboratory for chemical analysis. The results are independently audited and analysed statistically.

In accordance with the EMP, potable water was the only matrix sampled following the cessation of the 2022 season. The total number of samples analysed in 2022 along with summary statistics of silver concentrations is shown in Table 1. All measurements are well below the relevant guideline values.

Table 1: Summary of silver concentrations in 2022 potable water samples (ng/L). The guideline value for silver in potable water is 100,000 ng/L

Matrix	Number of samples	Minimum	Mean	Maximum	Guideline value
Potable Water	33	0.06	0.46	3.19	100,000

Aquatic ecology

Analyses of data collected following the 2018 season showed no evidence of any difference over time in the impairment of the macroinvertebrate assemblages or multivariate structure of edge or riffle assemblages which could be related to cloud seeding. Aquatic macroinvertebrates sampling will therefore take place after the 2023 cloud seeding season, in accordance with the EMP.

EPA Review

The EPA has undertaken a review of the Cloud Seeding Program 2022 Annual Compliance Report, in accordance with the SMCS Act and the EMP. In completing the review, the EPA consulted with the DPE, Environmental Protection Science section for the review of the report and National Parks and Wildlife Service (NPWS) in respect to cloud seeding operations that took place within Kosciuszko National Park.

The EPA concluded:

- *Snowy Hydro has complied with all of its obligations as detailed in the Act*
- *Snowy Hydro has complied with all of its obligations as detailed in the Environmental Management Plan for cloud seeding operations approved by the relevant Ministers on 28 June 2018*
- *Snowy Hydro has complied with all of its obligations as detailed in the Protection of the Environment Operations Act 1997*
- *Analysis of potable water sampling carried out during the 2022 cloud seeding season showed silver concentrations remain several orders of magnitude below relevant guideline values*

The recommendations were:

- *Monitoring be continued as per the schedule of the EMP, and data compared over time to identify trends*
- *Monitoring at all potable water tanks as per the schedule of the EMP, noting that the proposal to remove the intermediate sampling site will be considered in the 2023 review of the EMP*
- *Future reviews are also undertaken in consultation with input from partner agencies of the NPWS and DPE*
- *Snowy Hydro continues to pursue research opportunities on the cloud seeding operations in the Snowy Mountains*
- *The outcomes of this review are communicated to the relevant Ministers*

Conclusion

The Cloud Seeding Program 2022 Annual Compliance Report detailing cloud seeding operations and activities through 2022 was submitted to the relevant Ministers and EPA in March 2022. The EPA reviewed the report and confirmed Snowy Hydro has complied with all obligations set out in the SMCS Act and detailed within the EMP through the reporting period. There continues to be no evidence of any significant adverse environmental impacts associated with cloud seeding activities.
